> There may be something to run down for us. Cris wants to perform a helium test (similar to a
smoke test) to see if there's a physical connection between the lower and upper units, kind of
finding a pathway between the two units. As explained to us, one releases helium in the lower
unit and it flows up and you detect it in the upper unit... or not if it's airtight. Do you
have any experience in this area?? They are looking for a contractor, similar to HVAC, to do
this and give a certification of the findings.
